# DUNKLEY Filler/Weigher

The Dunkley Filler/Weigher is a fully automatic electric-over-pneumatic device used to fill and weigh a variety of containers used in the cold processing of fruits and vegetables. It reduces labor costs and improves the accuracy of the finished package.

The basic operating principle of the Dunkley Filler/Weigher is the simple, straight line advance of the container through four functional stations. Controls are electrically interlocked such that the function of each station must be completed in order that the circuitry is armed, or enabled, to allow the container to advance to the succeeding station. Versatility is designed into the control circuitry to allow full automatic operation with the tamper and sugar fill functions eliminated if so desired.

The capacity of the Filler/Weigher is ten 30 pound cans per minute of five plus one cherries and sugar.

## SPECIFICATIONS

Overall Height — 84"  
Overall Length — 92"  
Overall Width — 40"  
Height Floor To Bottom Of Tin — 24"

CAPACITY APPROX.  
12 — 30# CANS PER MIN.
